ABSTRACT

This document is a statistical report of the state and local revenue potentials and utilization of major tax sources. Statistical data for all 50 states and, since 1971, for the District of Columbia indicate that both collections and unutilized potential increased significantly from 1972 to 1973. The growth in collections was primarily due to economic growth (personal income) rather than adoption of higher rates and broader tax bases. Thus unutilized potential was permitted to grow along with collections. The growth in two measures was not evenly distributed. Regions stressing income taxes rather than property or sales taxes tended to experience the most impressive growth. (Author/HJH)

FOREWORD

As usual in this annual review of revenue potentials, the analytical spotlight which Dr. Quandry and his colleagues have focused upon the tax practices of the states has yielded a wealth of information, particularly for the Southern states. The emphasis, again, is on underutilized tax potential and again "the greatest percentages of underutilization are found in the SREB states."

Budgets of state-supported colleges and universities must reflect the reality of steadily increasing pressure for state support by public services competing with higher education. This applies to the South as elsewhere, but in the Southern states tax revenues comprise just 9.9 percent of personal income, compared with 11.4 in the nation.

Reports on ways in which the annual SREB analyses of revenue trends and patterns are used by state agency and educational planners and administrators help the authors focus more sharply on the issues which need attention. We welcome the continuation of this type of feedback.

The Center for Business and Economic Research at the University of Tennessee has helped make possible this analysis by generously providing for the use of computer facilities and making available the services of Stanley Chervin who wrote the program.

INTRODUCTION

This is the seventh consecutive year in which the Southern Regional Education Board has presented a statistical report of state and local revenue potentials and utilization of major tax sources.

The reports include statistical data for all 50 states and, since 1971, for the District of Columbia. Statistical comparisons are made to serve as a guide to states which may wish to seek more (or less) revenue than their present tax structure yields, or to revise their tax structures to meet the ever-new and more costly expenditure demands with increased equity.

It is not the purpose of this series of reports, nor is it the intent in any fashion, to suggest or recommend that public officials should search out new ways of increasing tax revenues or that any particular state should reform its revenue structure. Neither is it the purpose or intent to suggest that a particular state should strive to achieve the averages in tax effort upon which the analyses and comparisons are built. Particular conditions in any state may dictate that a state should either exceed or fall short of the computed averages. It is the duty of each state's officials to evaluate its ability and effort in taxation and its needs or demands for public services and then to decide on the state's course of action. The worth of the reports lie in their value as references and guides to

^{1.} Previous to 1967, the SREB presented similar statistical reports covering the SREB states in 1958 and 1962 and The National Education Association produced a report similar to the current SREB series for all states in 1961.

aid public officials in making the proper decisions should they seek to alter revenue receipts or to change the relative reliance on tax sources.

The financial problems of states and localities are far from solved in spite of reports of aggregate budget surpluses in recent years. These aggregate statistics mask the fact that some jurisdictions continue to experience financial difficulties while others have been able to grant tax relief and expand public services. They also mask the fact that several states still depend heavily on tax sources that are highly regressive and respond poorly to economic growth. 2

Three reasons account in large part for the comfortable fiscal situation in 1973. First, the introduction of federal general revenue sharing injected a sizable amount of money into the treasuries of states and localities late in 1972 and in 1973. The 1972 funds came late in the year and remained largely unbudgeted at the beginning of 1973. Second, during the period of unusual economic growth and inflation, changes in public service levels lagged behind revenue

^{2.} A tax is ragressive if the tax liability as a percentage of income increases as taxpayer income decreases. A tax is proportional if the tax as a percentage of income remains constant at all levels of income. A tax is progressive if the tax as a percentage of income increases as income increases. That is, a regressive tax places a greater tax burden on low income taxpayers (as a percentage of income) than on high income taxpayers. A progressive tax places the greater relative burden on the high income taxpayer and a proportional tax places an equal burden by this measure on all taxpayers.

A tax is assumed to respond well to economic growth if its revenue grows at a rate faster than the economic measure used. Thus, if personal income grows by one percent and tax revenue grows in excess of one percent the tax responds well to economic growth. If tax revenue is proportionally less than income growth, the tax does not respond well to income growth.

increases resulting from growth and inflation. Expenditure decisions remained conservative and tax structures, even the regressive ones, responded well to economic change. Third, many (but not all) states have strengthened their tax structures by enactments that create a system more responsive to growing levels of nominal economic activity.

However, when the nution returns to a more normal growth pattern, expenditure demands again can be expected to exceed revenues at current rates. The extent to which it may become necessary or desirable to raise additional revenue in future years depends upon the extent of expenditure programs and the responsiveness of the tax structure. In some jurisdictions, officials may have been fulled into a false sense of security by recent budget surpluses. They may have adjusted taxes downward or instituted new and costly expenditure programs. Either action can be expected to lead to future tax increases or to a reduction in service levels in the near future. States with relatively unresponsive tax structures will be obliged to enact new or higher taxes sooner and in greater magnitude than will those states with responsive structures just to maintain the current public service levels. 3

In summary, the end of the economic boom and excessive inflation, the failure of several jurisdictions to provide progressive (or at least proportional) tax structures, and the expectation of reasonably

^{3.} Evidence of the fiscal problems Tennessee state government will be facing between 1975 and 1980 is presented in a report being prepared by the Tennessee State Office of Planning, Nashville, Tennessee, for release in January 1975.

mild real economic growth over the remainder of this decade presage a return to the typical chronic revenue shortages experienced in general since World War II. While 1972 and 1973 have been years of general budget surpluses and tax reform, less emphasis will be placed on reform and more on garnering additional revenue, at least after 1975.

AN OVERVIEW, 1967 TO 1973

Since 1967, total state and local taxes have grown from \$61,429 million to \$122,889 million (in 1973), a growth of almost exactly 100 percent. In this same period unutilized revenue potential (revenues that jurisdictions might have received had they applied average tax rates) grew from \$11,645 million to \$22,994 million, an increase of 97.5 percent, and personal income increased by only 70.1 percent. Table A presents unutilized potential by major tax source for the years 1967 to 1973. There is no way that the growth in the unutil. ized potential can be attributed to either business or individual takes. However, the corporation income tax shows the lowest growth rate while the individual income tax shows a rather high growth rate. Other of these major taxes are levied on both individuals and businesses. Two things that should be noted in Table A are the return of the corporation income tax unutilized potential to a positive rating and the reduction in the growth rate (negative growth from 1972 to 1973) of unutilized potential for the motor vehicle license taxes.

TABLE A

STATE AND LOCAL UNUTILIZED TAX POTENTIAL 1967 - 1973 TOTAL AND BY WAJOR TAX SOURCE (In Thousands)

		Selective		Incom	Income Taxes		Motor	
	General Sales and Gross Receipts Taxes	Sales and Gross Receipts Taxes*	General Property Taxes	Individual	Corporation	Motor Fuels Taxes	"chicle License Taxes	Total
1967	\$1,983,180	\$1,109,417	\$2,860,768	\$3,256,216	\$1,291,226	\$274,941	\$298,021	\$11,645,328
1968	1,933,786	1,077,432	3,128,494	3,675,529	1,246,279	203,424	303,263	12,174,516
1969	2,286,415	1,288,867	5,520,495	4,508,307	1,425,781	215,289	335,499	14,229,868

AN OVERVIEW, 1972 TO 1973

From 1972 to 1973, the nation's personal income increased by 13.1 percent, while state and local taxes increased by 11.3 percent. Taxes as measured by the U.S. Commerce Department as a percent of personal income, decreased from 11.6 percent to 11.4 percent and from 11.8 percent to 11.6 percent as measured in this report. In the same period, per capita taxes increased from \$522 to \$577 (or from \$530 to \$586), a gain of 10.6 percent. The gain in unutilized potential continued its upward climb, rising by 17.2 percent.

In 1973 states used 95.8 percent of their tax capacity is opposed to 96.1 percent in 1972. In per capita terms, tax capacity in 1973 was equal to \$611, leaving \$26 unutilized. Respective figures for 1962 were \$551 and \$21. The growth in tax capacity registered an impressive 10.9 percent.

In terms of taxes per \$1,000 of personal income, tax capacity decreased from \$122.79 in 1972 to \$121.27 in 1973. Utilization equalled \$118.02 in 1972 and \$116.17 in 1973, leaving \$4.77 and \$5.10, respectively, unutilized.

Increases in taxes were experienced primarily because of the favorable economic climate. The substantial economic growth and inflation permitted many jurisdictions to meet expenditure demands without raising tax rates; in some areas, with sizable tax reductions, the outcome was a significant increase in unutilized potential, a reduction

^{4.} In this report profits from municipally owned liquor stores and public utilities are included in taxes.

in tax burdens per \$1,000 of personal income, and a largely illusionary reduction in tax capacity per capita as taxes continued to climb.

SOURCES OF DATA

the U. S. Bureau of the Census. State tax collections were published in State Tax Collections in 1973 and, with minor revisions, in State Government Finances in 1972-73 and Governmental Finances in 1972-73.

Aggregate local taxes (for the 50 states and the District of Columbia) by category of tax were published in Governmental Finances in 1972-73 and allocated to states by category on the basis of unpublished sample data furnished by the Bureau of the Census. Data on income and expenditures of municipally owned liquor stores and public utilities were published in Government Finances in 1973 and Governmental Finances in 1972-73, respectively. Data on income and population were reported in the U. S. Department of Commerce, Survey of Current Business (August 1974) and Current Population Reports, Series P-25, respectively.

Information on tax rate and other tax enactments came from reports published by the Commerce Clearing House, the states themselves, and the Federation of Tax Administrators.

METHODOLOGY

As noted above, the basic data from which the statistical tables were computed were published in various Department of Commerce reports or furnished in unpublished form by the department. State tax collections used were those reported in <u>Governmental Finances in 1972-73</u>.

Local taxes were reported by source for all states in that report.

The totals were allocated to states by source with the help of sample data supplied by the Department. Local receipts were added to state receipts to compute state-local taxes by source for each state.

Finally, on the assumption that net profits from public owned enterprises is a form of tax on the consumer of the products, profits from municipally-owned liquor stores and utilities were added to alcoholic beverage and public utility selective sales taxes, respectively. From this basic collection table, the published tables were computed.

In interstate comparisons, the basic statistical attack rested on the assumption that the average effort to collect revenue from any particular tax could be achieved if a state should choose to do so. That is, any state should be able to maintain its current level of tax collections from sources for which the state's effort is average or above and still increase its effort up to the average for sources for which the individual state's effort is below average.

The relative utilization of tax sources is dramatized by showing the amount of revenue possible in each state at average rates and then to compare this amount with actual collections.

With three exceptions, personal income was used as the common denominator to measure tax effort. For severance taxes, the common denominator most suited for computing an average rate was the value of taxable resources extracted from the air, land, and waters of the state. For motor vehicle-related taxes (motor fuels and license taxes) the number of registered vehicles seemed the most adequate measure of

tax capacity. Average tax rates are expressed as collections per \$1,000 of personal income, per \$1,000 of severed products, or per registered vehicle, respectively.

multiplied by the common denominator for each state in order to provide an estimate of potential revenue. Finally, the actual collections were compared with potential collections. If the potential were less than actual collections, a state was assumed to have no unutilized comparity. If netual collections were less than potential collections, the unutilized potential was measured as the difference between the two.

SOME CAUTIONS ON THE ASSUMPTIONS AND THE USE OF THE DATA

The availability of an adequate effective tax base, and the distribution of the base may, in some cases, render the assumptions unrealistic. Some types of tax bases are not uniformly available in all states. A few states with extensive extractive industries can use severance taxes profitably. A few states can tax the tourist industry extensively; the securities exchange industry is concentrated largely in New York.

The distribution as well as the average level of income may influence the degree to which a state chooses to utilize particular taxes,

^{5.} The average tax rate for a particular tax is computed by totaling collections from a particular source for all states effectively using that source and dividing the collections by the total of the common denominator for the same states and stating the quotient as dollars per the common denominator.

notably the personal income and sales taxes. Moreover, taxpayers paying high taxes of a particular type (e.g., consumption) would have their capacity to pay other types of taxes (e.g., income or property) seriously impaired. The overall level of taxation must be considered.

Some taxes are not as closely related to the common denominator used as is desirable. For example, the relationship of property values and personal income seem to vary extensively from state to state.

pay taxes and the distribution of the tax load. In some states more so than in others, taxpayers are contributing more to the public treasury relative to their ability to pay. Moreover, taxpayers are contributing a large share of their burdens in the form of regressive taxes in some states, while in others, tax emphasis is on progressive taxes. It is obviously less feasible to raise taxes in states in which above average effort is made or in which a substantial share of the tax burden (and any increase) falls on low income taxpayers.

THE STATISTICAL TABLES

The statistical portion of this report consists primarily of two series of tables. The next few pages include a series of tables (Tables B through 1) that present tax collections and unutilized potential for major tax sources by geographic region. These tables are identical to tables published in <u>State and Local Revenue Potential</u>, 1972 so that comparisons can be made easily. The second series of tables (Tables 1 through 37), also identical to 1972 tables, present details by state as well as by region. Tables 1 through 12 are basic tables.

Other tables (Tables 13 through 37) present the data in several ways and present other data that permit an evaluation of each state's ability and efforts to support demands put upon its taxable resources.

Finally, there is presented in Appendix A, major tax enactments of 1973 and 1974 (through September) that will significantly alter the states' tax practices. Statistical effects of these actions are not reflected in 1973 collection reports.

A number of measuring devices have been employed for interstate comparisons of tax capacity and effort. The most commonly used simple measures are income and population. While it is more popular to compare taxes in per capita terms, the more useful measure is personal income per capita. One argument for its use is that taxes are ultimately paid from current personal income. Another is that, while personal income is less than a complete measure of taxable resources, it seems to correlate well with most tax bases. Both measures of tax effort are presented in the tables.

The average level and the distribution of personal income affect the tax capacity and the degree of burden or effort that can reasonably be applied. Table 19 reflects, in addition to tax collections as a percentage of income as a measure of tax effort, this effort measure weighted by the average level of income. In other words, a tax equal to 10 percent of personal income is a greater burden if average income is low than if it is high. The measure in column 4 reflects this.

Table 35 lists the distribution of federal adjusted gross income by class for the states, but no weighting can be made.

Tax effort or burden is also influenced by the extent of use of nontax revenue sources. Some states by choice garner relatively larger amounts of revenue from state or local nontax sources or are able to exact federal funds in relatively large amounts. Taxes as a percentage of general revenues from own sources, and federal aids as a percentage of general revenues, are also reported in Table 19.

e? .

Tables 20 through 34 list the net unutilized potential of the SREB states individually and totally. By net unutilized potential, it is meant that amounts collected above the average tax yield from some sources were subtracted from amounts collected below the average tax yield from other sources. Table 36 adds actual collections to net unutilized capacity and thus computes collections on the average of all states. This is termed for present purposes as tax capacity. The percent of capacity unutilized and the capacity and utilization per capita and per \$1,000 of personal income is listed by state. States overutilizing this capacity measure are found in the New England and the Pacific areas. The greatest percentages of underutilization are found in the SREB states.

TAX COLLECTIONS IN FISCAL 1973

state and local tax collections by state and by source are reported and analyzed in relation to potential collections in 37 statistical tables. Major tax sources are summarized to simplify the analyses in the tables in this section. In some cases, nonrecurring or windfall amounts are included in collections; thus, normal collections are inflated. In others, tax rate or base changes may have been effective for only a part of the fiscal year. No attempt is made to note all such instances.

Tax Collections and Unutilized Potential

Total tax collections increased from \$110.4 billion in 1972 to \$122.9 billion in 1973, an increase of 11.3 percent. Increases by type of tax are listed in Table B. Since rate and base changes had little net influence on revenue growth, the greatest percentage gains are reflected in sources most responsive to personal income growth. In both 1972 and 1973, total taxes and personal income showed an almost one-to-one growth relationship; however, the income taxes responded well above this relationship and general property and several minor taxes well below.

According to data in Table C, total unutilized potential increased by \$3.4 billion, from \$19.6 billion to \$23.0 billion, a gain of 17.2 percent. In general, highest unutilized potential growth rates were found in taxes which respond well to personal income growth. Growth in the utilized and unutilized potential portions of the tax

base move in the same direction at somewhat the same magnitude if undisturbed by changes in the rates or bases. The percentage change was above 10 percent except in two cases. Unutilized potential showed an insignificant decrease in the alcoholic beverage licenses and a growth of 8.7 percent in the severance taxes. The three basic taxes account for about 88 percent of the unutilized potential with the individual income tax leading the way, followed by the general property and the general sales taxes.

and percentage wise, were registered in the SREB states, followed by the Middle Atlantic and the New England states (Table D). About three-fourths of the increase in tax collections were divided almost equally among the SREB, the Middle Atlantic, and the North Central states, while four-fifths of the unutilized potential was found in the SREB, the North Central and the Pacific states. The SREB states lead in both categories and rank third behind the Mountain and the North Central states in personal income gains. These same groups of states contained from two-thirds to three-fourths of the population, income tax collections, and tax potential in 1973.

Statistics in Table D indicate that only the Middle Atlantic states and the District of Columbia took substantial advantage of their rising tax potential to increase the tax take. In the other regions the unutilized potential increased at a faster clip than did the tax revenues. In the Pacific, the Mountain, the North Central, and the SREB states, where income growth was greatest in percentage terms, so also was the growth in unutilized potential.

The following analyses discuss tax collections practices by tax source. The reasons for diversity in collections as measured by a common yardstick can be accounted for by differences in rate, base coverage, or administrative vigor. Underutilization results if rates are low, if the bases are relatively narrow (a large number and amount of exemptions or special low rates), if the tax is poorly administered, or if it is not used at all. Overutilization results from the opposite—high rates, broad bases, vigorous administration, or wide—spread use of the tax base (state and extensive local use, for example).

The General Sales and Use Taxes (Tables 1 and 13)

The base utilized for general sales taxation varies greatly from state to state. In many cases broad exemptions are offset by high rates. Appendix Table 2-A lists current tax rates. Tax bases are complex and difficult to compare; however, large exemptions can be readily identified. For example, 15 states exempt food for home consumption. These states apply relatively high rates. In addition to complete exemption of food from the tax base, the District of Columbia and Louisiana have special lower rates, and North Dakota has a limited exemption for meat and milk products. Thirty states have full or limited exemptions for drugs and medicines. Other states either exempt or tax at special lower rates many items of manufacturing machinery, pollution control facilities and other items related to agricultural or industrial production.

į

28

Practices vary in the taxation of services and in tangible goods such as gasoline, liquor, public utility services, and admissions which are traditionally taxed under selective sales tax statutes. The sales may be excluded from general sales taxation, or they may be taxed under both the general and the special levies.

Four states (Delaware, Montana, Oregon, and New Hampshire) did not employ a general sales tax in 1973. As of that year, twenty-six states permitted one or more of their local governments to levy a local sales tax, but only twenty-one used the privilege extensively. Most widespread use of the local tax was found in Alabama, California, Illinois, Oklahoma, Tennessee, and Texas.

General sales tax revenues increased to \$22,992 million in 1973, a gain of 13.3 percent from the 1972 amount. Unutilized potential grew by 17.1 percent to \$2,971 million. Increases were substantial in all geographic regions (Table E). They were in excess of 15 percent in the New England states, the Mountain states, and the District of Columbia (due to rate raises), and in excess of ten percent in every region. The areas and states making good use of their rapidly increasing potential demonstrated the least increase in unutilized potential.

Collections per capita and per \$1,000 of personal income were highest in the Pacific states and lowest in the New England states. The SREB states demonstrated the fullest utilization of the tax base, showing only \$7.60 per capita and \$1.72 per \$1,000 of personal income of unutilized capacity. Among these states, Maryland showed the greatest degree of underutilization. In total, twenty-nine states

showed some degree of underutilization, five of which were SREB states.

Three of nine Mountain states and three of five Pacific states were
in the category of underutilization.

The Selective Sales Taxes (Tables 2 and 14)

Data are presented in Tables 2 and 14 and summarized in Table F for four major selective sales taxes and for one cateogry including all other selective sales taxes. In total, collections increased to \$12,129 million in 1973, or 10.6 percent from 1972 to 1973, while unutilized potential increased by 11.5 percent to \$2,586 million. The most productive taxes are the public utilities (over \$3.7 billion) and the tobacco products (about \$3.3 billion). With the exception of insurance premiums, the bases of these taxes are generally included in the general sales tax base. This fact can influence the intensity to which the base is taxed under selective levies.

For purposes of this study, net profits of publicly owned utilities and liquor stores were combined with state and local taxes.

Seventeen states distribute liquor through state owned stores and three through municipally owned stores. However, data on municipally owned stores in Minnesota, North Carolina and South Dakota were not available for inclusion in the statistical tables. Finally, every state reported municipal operation and ownership of one or more public utilities. States have the option of taxing private enterprises, permitting local taxation of private enterprises, or of owning them and contributing all or part of the profits to the general fund in lieu of taxation.

Alcoholic beverage, cigarette, and insurance premiums sales taxes were employed in all 50 states and the District of Columbia in 1973.

One state (Massachusetts) did not report any revenue from a public utility sales tax.

Cigarette tax rates vary from a high of 21 cents per package of 20 in Connecticut to a low of 2 cents in North Carolina. Of the 50 states, 30 have rates of 12 cents or above (13 above 15 cents), and only 13 have rates below 10 cents. States with high rates typically collect above average revenues, while those with low rates collect below average. As in past years close to 40 percent of the unutilized potential is found in the SREB states because of low rates in North Carolina (2 cents), Kentucky (3 cents) and Virginia (2.5 cents). About one-third of the states supplement cigarette taxes with taxes on other tobacco products.

Statistics in Table F indicate that, while collections increased almost as fast as unutilized potential in percentage terms, one region (North Central) failed notably to take advantage of its increasing potential. In that region revenues increased 9 percent while unutilized potential grew by 21.4 percent. Comparable figures for the nation were 10.6 percent and 11.5 percent, respectively. In dollar terms revenues grew to \$12,129 million (by \$1.158 million) and underutilization to \$2,586 million (by \$266 million).

Death and Gift Taxes (Table 3)

State death and gift taxes normally have graduated rates. They are further complicated by having separate rate schedules for heirs

of differing kinship or relationship with the deceased. Exemption policies in regard to charitable contributions and types of property as well as those regarding individuals vary widely. No local units employ death or gift taxes.

Some states impose a death tax solely for the purpose of reclaiming the federal credit. Other states employ an additional estate or inheritance tax. Fifteen states levy a gift tax. Five states (Alabama, Alaska, Arkansas, Florida, and Georgia) use a "pick-up" tax only; two states (South Dakota and West Virginia) use an inheritance tax only; two states use an inheritance, estate, and pick-up tax (Oregon and Rhode Island); two states use an estate tax only (Mississippi and North Dakota); seven states (Arizona, New York, Ohio, Oklahoma, South Carolina, Utah, and Vermont) use an estate and pick-up tax; and one state (Nevada) has no death or gift tax. The complexity and diversity of the taxes used is equally important to the complex and diverse rate and base structures in evaluating the revenues and potential revenues.

Ninety percent of the unutilized potential in 1973 was found in the SREB and the North Central states, areas in which only one-third of the tax was collected. No underutilization was evident in the New England or the Middle Atlantic states. The SREB states alone accounted for almost one-half of the nation's underutilization.

^{6.} California, Colorado, Delaware, Louisiana, Minnesota, North Carolina, Oklahoma, Oregon, Rhode Island, South Carolina, Tennessee, Texas. Virginia, Vermont, Washington, and Wisconsin.

From 1972 to 1973 collections increased to \$1,437 million, an increase of 11.2 percent and unutilized potential to \$329 million, an 11.5 percent increase.

The Property Taxes (Tables 4 and 15)

Continuing past experiences, property taxes in 1973 were used least intensively in the SREB region and most intensively in the New England region (Table G). Though the North Central states are traditional heavy users of property taxes, revenue growth was minimal from 1972 to 1973. On the other hand, underutilization increased by 51.9 percent.

Property taxes remained the largest source of state and local tax revenue in 1973 as in past years, though the percentage of total collections shows a substantial decline from 1972 to 1973 (38.2 percent to 36.9 percent of total collections). In absolute terms, growth in property taxes (1972 to 1973) exceeded all others, but in percentage growth terms, it registered the least growth of the major tax sources and only two-thirds the growth of all taxes.

Even with this moderate growth in revenues, the tax burden and its growth are less than these statistics indicate. All 50 states have some form of property tax relief; about two-thirds of the states finance the relief from the state treasury. Relief is generally slanted toward the disadvantaged taxpayers (aged, disabled, low income) so that the burden of the tax is further relieved. On the other hand property taxes at the local level are not substantially reduced because the state picks up the cost.

Note: Parts may not add to totals due to rounding.

Source: Kenneth E. Quindry and Richard A. Engels, State and Local Revenue Potential, 1972 (Atlanta: Southern Regional Education Board, 1974), Table 4; and Table 4, this report.

Because of complex and diverse homestead relief programs, selective credits, exemption practices concerning personal property and tax exempt institutions, selective exemptions to encourage industrial development, lack of data on local practices, etc., it is impossible to evaluate state- or region-wide bases and rates. The quality of administration and of the assessment of property for tax purposes also influences the level of tax collections.

Underutilization increased from 1972 to 1973 by \$3.36 per capita, but only \$0.01 in terms of dollars per \$1,000 of personal income. Underutilization in the SREB region was more than twice the closest competitor, the Mountain region (\$69.22 to \$30.95 per capita and \$15.68 to \$6.77 per \$1,000 of personal income). Underutilization by both measures in every region except the New England region, increased from 1972 to 1973.

The Individual Income Taxes (Tables 5 and 16)

Six states (Florida, Nevada, South Dakota, Texas, Washington, and Wyoming) did not employ an individual income tax in 1973. Four states (Connecticut, New Hampshire, New Jersey, and Tennessee) restricted the levy to selected income sources. The remaining 40 states employed a broad based tax. Ten states (Delaware, New York, Pennsylvania, Michigan, Missouri, Ohio, Alabama, Kentucky, Maryland, and California) permitted a local levy in addition to the state levy in one or more jurisdictions. Thirty-five of the forty states employed progressive rate structures and five (Illinois, Indiana, Nebraska, Ohio, and Pennsylvania), flat rates. Personal deductions and

١

exemptions and practices concerning business expenditure deductions vary, though conformity to federal regulations is fast becoming standard.

In addition to being influenced by the composition of the tax rate structure and deduction and exemption policies, productivity of this tax is influenced also by the distribution and level of taxable income. If a high proportion of the taxpayers are in a low income class, productivity will be low relative to total income. In some states low income families and individuals are fully exempted from liability because of liberal exemption and deduction policies. Conversely, a large relative number of middle and high income taxpayers provides high tax productivity. Table 35 lists the percentage of families by federal adjusted gross income class by state for 1971.

The SREB region continued, in 1973, to make less use of this source than did other regions, largely because two important states (Florida and Texas) do not apply the tax. Maryland employs the tax effectively at both the state and local levels. Georgia, Kentucky, North Carolina, South Carolina, and Virginia have reasonable income tax yields among the SREB states, but are still below the national average in per capita collections with the exception of Virginia (Table 16). Both North Carolina and Virginia rank above the national average in collections per \$1,000 of personal income.

Property and sales tax relief granted through income tax credits is generally treated, not as a reduction in income taxes, but as a transfer payment to individuals. The net result is to inflate tax collections by the amount taken from some taxpayers and then returned

to them or to other taxpayers. The programs are essentially tax programs to redistribute income.

According to data in Table H, collections from 1972 to 1973 increased most in the North Central region and least in the Pacific region. Conversely, the underutilization increase was greatest in the Pacific region and least in the North Central region. Total collections grow by \$2,736 million to \$17,970 million, a gain of 18.0 percent, while unutilized potential grow by \$1,443 million or 24.3 percent.

The Corporate Income Taxes (Tables 5 and 17)

For the second year in a row, corporate income tax collections increased in excess of 20 percent (28.3 percent from 1971 to 1972 and 23.8 percent from 1972 to 1973). The 23.8 percent growth in 1973 produced an increase to \$5.55 from \$5.09 per \$1,000 of personal income in the 46 states employing this revenue measure. Underutilization increased to \$1,446 million (up by 13.1 percent from 1972), mainly because corporate profits (the tax base) grew at a substantially faster rate than personal income (the common denominator by which effort and underutilization were measured).

In analyzing state performance, somewhat the same procedures should be followed as were used for individual income taxes. Productivity is influenced by both the rate level and the inclusiveness of the base. Tax bases are being standardized along federal lines. The use of federal depletion allowances, investment credits, and depreciation practices is becoming common.

Corporate income tax for District of Columbia was reported in individual income tax columns and tables in 1972 and separately in 1973.

Source: Kenneth E. Quindry and Richard A. Engels, State and Local Revenue Potential, 1972 (::lanta: Southern Regional Education Board, 1974), Table 5; and Table 5, this report.

Revenue increases for the North Central, SREB, Mountain, and the Pacific regions varied from 29.4 percent to 33.3 percent, but lagged in the New England and the Middle Atlantic regions (10.4 percent and 11.5 percent). In spite of the relatively low gains in the Middle Atlantic region, unutilized revenue potential fell by 11.7 percent. The bulk of the increased collections in the SREB states resulted from higher collections in Florida and Tennessee. In Florida, a full year's collection was reported for the first time, and Tennessee instituted a program speeding up collections (on a quarterly basis) and substantial windfall payments resulted. These events accounted both for the high percentage growth in revenues and the low growth rate of unutilized potential.

Licenses and Motor Fuels Taxes (Tables 6, 7, and 8)

License taxes are reported in two categories: state alcoholic beverage licenses (Table 6) and motor vehicle license taxes including local vehicle and drivers license fees (Table 7). Other license taxes are listed in Table 11. Motor vehicle fuels taxes (Table 8) are discussed along with vehicle license taxes rather than with other selective sales taxes because both motor vehicle-related taxes are generally earmarked for highway use. All states and the District of Columbia employ all three of these sources of tax revenue.

Alcoholic Beverage Licenses (Tab: 6)

License taxes are placed by the state on sellers, handlers, and producers of alcoholic beverage products in every state except Hawaii.

Localities in several states also collect revenue from this source, but state-by-state data are not available for inclusion in Table 6.

Local collections are included in Table 11.

Publicly owned liquor stores are not subject to all license fees. In several states, pockets of prohibition and abstinence restrict revenue productivity. In others, special concessions are granted to local producers.

Revenue from this source grew by only 4.0 percent from 1972 to 1973, to \$141.5 million as opposed to a mild decrease in unutilized potential. Almost three-fourths of the unutilized potential (but only two-fifths of the tax collections) are attributed to the North Central and the SREB regions.

Motor Vehicle Licenses (Table 7)

The analyses for motor vehicle related taxes in Tables 7 and 8 employed average collections per registered motor vehicle as the measure of tax ability and effort. An average collection per registered vehicle was computed and the average was multiplied by the number of vehicles in a state to compute potential revenue.

Differences in the ratio of automobiles to trucks and buses may cause some variations in collections. Automobile registrations, however, make up the bulk of registrations in every state.

The relative productivity of this source may be explained in two additional ways. Some states secure motor vehicle use revenue more heavily from fuels or property taxes instead of mounting a vigorous effort in levying license fees. A few states apply the

general sales tax rate to motor fuels to..., possibly in lieu of higher license fees or special fuel taxes.

Widespread use of local license or inspection fees is indicated in twenty-one states (ten of which are in the SREB and six of which are in the North Central region).

License tax revenue increased by 9 percent to \$3,635 million, while unutilized revenue grew by 18.6 percent. Revenue gains were rather evenly distributed by region, but in one region (New England) the underutilization decreased.

Motor Fuels Taxes (Table 8)

Motor fuels taxes are gallonage taxes based on sales of gasoline and other fuels used to propel or otherwise operate motor vehicles on the public highways. Minor amounts of taxes come from operating combustion engines in boats and airplanes or from other uses. The gasoline tax is supplemented with taxes on diesel fuels and low pressure gas except in one state (Vermont). The tax rate ranges from 5 cents per gallon in Nevada to 10 cents in Connecticut. Three states have a rate of less than 7 cents, 17 have a rate of 7 cents, and 17 have a rate exceeding 7 cents but less than 9 cents, and 13 have a rate of 9 cents or above. In Hawaii, rates vary from 8 to 10 cents by county. Since the base differs little by state, major productivity differences are mainly due to the rate differences. however, a few states levy a tax on motor oils and lubricants, and others authorize local fuels taxes. Finally, practices differ in regard to refunds for nonhighway use and in regard to discounts for evaporation and spillage.

Total collections increased to \$8,123 million or by 11.7 percent from 1972 to 1973, as opposed to an increase of 18.5 percent in unutilized potential. Rate increases accounted for a significant part of the growth in collections. Highest percentage growth in collections was in the Middle Atlantic and the SREB regions. The middle Atlantic region erased its unutilized potential of 1972, largely by application of higher rates in New Jersey and New York. The growth in unutilized potential was significant in the New England and the Mountain regions.

Severance Taxes (Table 9)

Severance taxes are imposed on the value of natural resources as they are severed from the land or water. They may be applied in lieu of or in addition to property or other taxes. Thus, their application may influence the productivity of other taxes.

Because some states have no significant commercial extractive industries, value of severed products is a better relative measure of revenue potential than personal income. To compute revenue potential, an average rate per \$1,000 of severed products was computed and multiplied by the value of severed products.

Severance taxes are most practicable and profitable in states having high concentrations of oil and gas production. States having extensive production of timber, fish, sand, and gravel are less inclined to impose production taxes because of the low profitability of these industries. Coal production has moved out of this last category within the last year. Both Kentucky and Tennessee have recently

adopted coal severance taxes. Especially in Kentucky, the revenue is proving to be substantial.

Louisiana, Oklahoma, and Texas are unique in their ability to exploit oil and gas taxes. However, several other states with substantial oil and gas production (e.g., California, Illinois, and Pennsylvania) have failed to utilize this source of taxation extensively. In Minnesota, taxation of iron ore extraction is relatively remunerative.

Severance tax revenues reached \$85.4 million in 1973, up by 12.3 percent from the 1972 figure, while the unutilized potential increased only 8.6 percent, to \$460.9 million. Four-fifths of the collections (mostly in Louisiana and Texas) and one-fourth of the underutilization was located in the SREB states. Most of the SREB underutilization was found in Virginia and West Virginia (coal) and in Florida (fisheries and mining).

Transfer Taxes (Table 10)

Transfer taxes include a wide range of levies on real estate transfers and transfers of nontangible wealth (mortgages, stocks, and bonds). Productivity of the tax is affected by the inclusiveness of the base as well as by the rates. New York is in an especially favorable position to garner revenue from a documentary transfer tax. About one-half of all transfer taxes are collected in that state.

Attention should be called to the fact that only state taxes are included in Table 10. Many states levy only a local tax; others,

both a state and a local tax. Local taxes are included in the "other and unallocable" column of Table 11.

Transfer tax revenues grew by 11.9 percent to \$565.6 million, and underutilization by 26.4 percent to \$439.1 million. Underutilization centered in the North Central region (one-third of the total) followed by the SREB and the Pacific regions (with approximately one-fifth each).

Miscellaneous, Other, and Unallocable Taxes, Total Taxes (Table 11)

Two other tax sources merit brief mention. Pari-mutuel taxes are reasonably productive in a few states where the traditions of horse and dog racing are strong and where there is extensive tourism. A few states still maintain legal prohibitions against race track betting. At least one state (New York) has extended wagering to off-track betting. Nevada collects significant revenues from casino gambling, but so far other states have not adopted this revenue source.

State lotteries are now being used in at least 8 states. Others are considering their adoption. Legal prohibition still exists in a number of states, but social acceptance seems to be gaining ground, if for no other reason than that lotteries are viewed as an alternative to higher property taxes. Improvements in administration and adjustment in prizes have increased their productivity and popularity.

SUMMARY AND CONCLUSIONS

The data presented in this report indicate that both collections and unutilized potential increased significantly from 1972 to 1973. The growth in collections was primarily due to economic growth (personal income) rather than adoption of higher rates and broader tax bases. Thus, unutilized potential was permitted to grow along with collections. The growth in the two measures was not evenly distributed. Regions stressing income taxes rather than property or sales taxes tended to experience the most impressive growth.

The major shift in relative tax shares (Table 16) from 1972 to 1973 was that general property taxes decreased from 38.2 percent of total taxes to 36.9 percent. Individual and corporate income taxes increased in the share of the total.

Relative tax burdens did not shift significantly from 1972 to 1973. Tax burdens as a percentage of personal income were down slightly in 1973. The burdens in the New England and the Middle Atlantic regions rose slightly, and in other regions they were reduced. The District of Columbia also increased its tax burdens. In all, 7 states and the District of Columbia increased the tax take as a percentage of income, and 43 reduced the tax take.

Several things limit the adequacy of the percent of income paid in taxes as an adequate measure of tax burdens. This measure does not reflect the distribution of income, only the total amounts.

Column 4 of Table 19 reflects in the measure of burdens the average or per capita level of incomes. According to this measure, Vermont

taxpayers, rather than those in New York, become the most heavily taxed in the 50 states including the District of Columbia. Since 1970, by this measure, Mississippi has been replaced by both Vermont and Maine in the highest taxed category.

Statistics in this report give no consideration to the amount of taxes nominally levied on individuals and businesses but shiftable to out of state taxpayers. Tax exporting is significant in major manufacturing states and certain states using taxes on extractive industries.

Data discussed up to this point refer only to underutilization of a particular source without due consideration to possible over-utilization of other sources. Tables 20 through 34 report both over- and underutilization and the net underutilization by tax source for the SREB states. Table 36 (column 2) lists the net underutilization for every state and the District of Columbia. Net unutilized capacity reached only \$4,459 million, about one-fourth of gross underutilization, indicating that some states were overutilizing their tax sources in many areas. In ten states, there is net overutilization indicated. Net underutilization in the amounts of \$21.14 per capita or \$4.77 per \$1,000 of personal income is indicated.

NOTES AND SOURCES FOR TABLES

(Figures in columns and rows may not add to totals because of rounding)

TABLE 1

The average rate per \$1,000 of personal income for states using this tax is \$22.179.

Figures for the following states reflect state <u>and</u> local general sales tax collections: New York, Illinois, Kansas, Minnesota, Missouri, Nebraska, Ohio, South Dakota, Alabama, Arkansas, Georgia, Louisiana, Mississippi, North Carolina, Tennessee, Texas, Virginia, Arizona, Colorado, Nevada, New Mexico, Oklahoma, Utah, California, and Washington. Alaska has a local general sales tax only.

SOURCE: Population: U. S. Bureau of the Census, Population Estimates and Projections, Series P-25, No. 508, November 1973 (provisional July 1, 1973 estimates); Personal Income: U. S. Department of Commerce, Office of Business Economics, Survey of Current Business, August 1974, Tables 1 and 2; State Collection Data: U. S. Department of Commerce, Bureau of the Census, State Government Finances in 1973, Series GF73, No. 3, August 1974, Table 7; Local Collection Data: U. S. Department of Commerce, Bureau of the Census, Government Finances in 1973, Series GF73, September 1974, Tables 4 and 17; and estimates based on disaggregated local tax collection data furnished by U. S. Department of Commerce.

TABLE 2

The average rate per \$1,000 of personal income for states using these taxes are as follows: for alcoholic beverages, \$2.161; for tobacco products, \$3.107; for insurance taxes, \$1.526; for public utility taxes, \$3.645; and for other selective sales taxes, \$1.166. Alcoholic beverage taxes include profits from state operated stores. Public utility taxes include profits from locally owned utilities.

Minnesota, North Carolina, and South Dakota nei profits from municipal liquor stores not included in alcoholic beverage tax computations.

Public utility sales tax figures for all states include local sales taxes and/or profits in the cases of publicly owned utilities except in Massachusetts, which collects no public utility taxes.

Alcoholic beverage tax figures for the following states include state liquor store profits: Maine, New Hampshire, Vermont, Pennsylvania, Iowa, Michigan, Ohio, Alabama, Mississippi, Virginia, West Virginia, Idaho, Montana, Utah, Wyoming, Oregon and Washington.

Bureau of the Census, Census of Agriculture, 1969, Volume II, General Report, Chapter 7, Value of Products, Economic Class, Contracts (Washington, D.C.: U. S. Government Printing Office, 1973), Table 3.

TABLE 10

The average rate per \$1,000 of personal income for states using this tax is \$.619.

New York and Texas were excluded in the computation of the average rate.

Local realty transfer tax an city of Wilmington, Delaware, at a rate of one percent.

Local tax in New York City on transfers of real property where consideration is over \$25,000.

Local taxes authorized in Pennsylvania. Over 1,000 school districts and 850 other units impose this tax.

Tax in Indiana restricted to corporations subject to gross income tax.

A local tax is authorized in Ohio, South Carolina, West Virginia and California.

City of saltimore, Maryland, and specified counties are authorized to levy this tax.

Virginia counties and cities levy a tax of one-third the state tax.

In Washington, a county tax is authorized and employed in all 39 counties, on real estate at a one percent rate.

APPENDIX A

MAJOR TAX ACTIONS IN 1973 AND 1974

MAJOR TAX ACTIONS IN 1973

1973 was a significant year for state tax activity. Following almost three decades of major tax increases, state revenue-raising almost stopped this year. Although many states enacted increases (See Table 1-A), most of these raises were of minor dollar importance or were designed to finance property tax relief. In fact, rate reductions and the especially widespread property tax relief were more customary during 1975 with the number of major rate decreases exceeding the number of major rate increases. Several factors accounted for this trend reversal. With rapidly rising prices and income and expanded tax systems, revenues had grown quickly. Expenditure requirements had increased less rapidly; education raises, for example, were tempered by slower growth in attendance or greater property tax relief. Federal revenue sharing appearing in state budgets for the first time also provided significant leeway for tax reductions. Major revenue-raising legislation enacted in 1973 is listed in Table 1-A and discussed briefly below.

General Sales Taxes

Only Indiana increased its general sales tax rate from 2.0 percent to 4.0 percent to help finance a property tax relief program. Food items for home consumption were made exempt, though, and the gross income tax on wholesale and retail sales were to be phased out until 1992 when no tax will be imposed. California postponed the

increase in its general rate from 3.75 percent to 4.75 percent from June 1 to July 1, 1973, and then reduced the rate temporarily to 3.75 percent October 1 through March 1974, when it was scheduled to return to 4.75 percent. Tennessee postponed reducing its temporarily increased rate of 3.5 percent until July 1, 1974, when the rate was to drop to 3.0 percent. The sales tax rate was cut in Connecticut from 7.0 percent to 6.5 percent. State rates as of October 22, 1974, are listed in Table 2-A.

Touristana also exempted food, and North Dakota expanded its food exemption to more items. Exemptions for drugs, medical supplies, school books, pollution control equipment, food sales in special nutrition programs, and sales by nonprofit organizations continued to proliferate. Hawaii broadened the eligibility of the disabled for the special low 0.5 percent tax. Although special relief was accorded many items such as boiler fuel and returnable containers, some items lost their special tax treatment—notably the lowa sales tax credit for fuel tax and purchases by public utilities in Indiana not directly used in providing utility services.

A Denver Metro Transit general sales tax of 0.5 percent was approved by the voters, and Wyoming authorized a 1.0 percent county sales tax. The upper limit of Kansas local sales tax rate was raised from 1.0 percent to 1.5 percent, and Oklahoma cities and towns were permitted to tax sales up to 2.0 percent. Missouri allowed local governments to enact a 0.5 percent sales tax for transportation purposes.

Individual Income Taxes

Tax rates were raised only in Delaware, which increased the rate range by 10.0 percent. In addition, Delaware expanded the base to include all capital gains and interest from U. S. government securities. Arkansas made dividends from financial institutions taxable.

Several states reduced individual income tax rates. California provided for a one-year sliding scale tax credit. Nebraska dropped its overall rates from 15.0 percent of federal liability to 13.0 percent in 1973 and 11.0 percent in 1974. Both New York and New Jersey suspended their 2.5 percent tax surcharges for 1973. Arkansas exempted those below certain income levels and reduced rates for some incomes in excess of these levels. Persons filing a joint return in Ohio in 1973 and 1974 are allowed a credit against tax, ranging from 20 percent when adjusted gross income is \$10,000 or less to 5 percent when adjusted gross income is \$20,000 or over. Michigan, Mississippi, Wisconsin, and Idaho (temporarily) raised personal exemptions.

More specific relief included the following: higher standard deductions and additional deductions and exclusions in Mississippi; higher minimum net income for paying taxes in Iowa and Wisconsin; deductibility of federal income taxes in Louisiana; exemption of public pensions by Minnesota; and elimination of the tax on dividends by Connecticut. Utah and North Dakota revised their tax rate schedules with the result that taxes paid by some persons increase and those paid by others decrease.

Indiana authorized its counties to impose a levy of up to 1.0 percent of adjusted gross income of residents and up to 0.25 percent

for nonresidents, and 31 of its 92 counties promptly adopted the new levy. The Detroit school district was authorized to impose a surtax on the city's individual and corporate income taxes.

Corporate Income Taxes

Income tax rates on corporations were raised in Indiana from 2 percent to 3 percent, and a supplemental income tax to be equal to 3 percent by 1977 was also imposed. Maine raised its rates too from a flat 4 percent to 6 percent on net income over \$25,000 on July 1, 1973, and then to a 5 to 7 percent range on January 1, 1974. New Jersey enacted a 7.25 percent supplemental corporation income tax on corporations not subject to its franchise tax. Kansas permanently discontinued the deduction for federal income taxes, and Montana both made permanent its temporary higher tax and eliminated a temporary decrease. Delaware continued existing rates by replacing a temporary surcharge with a higher basic rate of 7.2 percent. Oregon, where voters defeated a proposed new business profits tax and a corporate income tax rate raise, subjected all business trusts to its income tax. Nebraska, however, lowered its general rate from 3.75 percent to 5.25 percent, and Louisiana made federal income taxes deductible.

Several states imposed new or higher income taxes on financial institutions. Alaska increased rates on banks, and Georgia applied its income tax to banks. National banks in Utah became subject to that state's income and excise taxes. Wyoming (temporarily) and Arkansas replaced bank share taxes with income taxes on banks, and Minnesota continued its temporary, higher rates on banks until

j .]

January 1, 1974. New Jersey and Florida imposed income taxes on savings institutions, and all savings funds of Maryland savings institutions became subject to that state's franchise tax. Connecticut made domestic insurance companies subject to its franchise tax.

Selective Sales Taxes

Delaware (temperarily), Arkansas, and Michigan increased motor fuel taxes. Illinois made all watercraft fuel subject to its motor fuel tax, and North Dakota imposed an excise tax on jet fuel. The New York motor fuel road tax on interstate buses, scheduled to expire in June 1975, was continued indefinitely. Connecticut authorized the levy of a gasoline tax by transit districts. Louisiana repealed its lubricating oils tax.

The digarette tax was increased only in Colorado. Iowa imposed the digarette tax on little digars. Arizona and Virginia raised the wholesalers' discounts, and Kansas levied a privilege tax on distributors of tobacco products. Motor fuels and digarette tax rates (as of October 22, 1974) are reported in Tables 3-A and 4-A, respectively.

Tax rates on all alcoholic beverages were increased in Indiana, while the rates on wine were increased in Washington. South Carolina doubled the tax on nonstandard cases of liquor. Georgia authorized municipalities and counties to impose a local excise tax on the sale of mait beverages. The rate on distilled spirits was reduced in Minnesota.

The Hawaii rate is a percentage of wholesale price.
 The New Hampshire rate is based on value sold at retail measured by usual selling price.

Other Taxes

Increased relief from property tax burdens in the form of income tax credits and exemptions continued to grow. In 1973 more than two-thirds of the states adopted or expanded selective types of personal property tax relief and real property tax relief to the elderly, to the disabled, to those with low-to-moderate incomes, and across the board. Before the end of the year all states had some form of relief.

Estate taxes were increased in Oklahoma, reduced in Wisconsin and Utah, and newly imposed in New Mexico. Wisconsin also lowered its gift and inheritance tax rates. North Carolina granted the surviving husband the same inheritance exemption as the surviving wife.

Minnesota imposed a new excise tax on employers based on the taxable compensation paid by them to employees. Indiana increased the license tax on certain motor vehicles, and Louisiana repealed its ta es on the generation or sale of electricity and the use of power.

Massachusetts imposed a temporary surtax on domestic insurance companies, and New York reduced the supplemental taxes on domestic insurers. Mississippi and North Carolina reduced or eliminated taxes on premiums on federall, qualified insurance and annuity plans.

Alaska increased its gross production tax on oil and lowered an alternative per barrel tax. Louisiana increased its severance tax rate on gas and placed its oil severance tax on an advalorem basis.

Montana increased the maximum oil and gas conservation assessment and levied an extraction tax on all minerals. Alabama imposed a privilege

127

tax on those who process forest products or use them in manufacturing, and Oregon enacted a temporarily higher forest products harvest tax.

Nebraska and New York raised pari-mutuel rates, and Connecticut and Maine lowered certain pari-mutuel rates.

A federal law enacted in 1973 now prohibits states from imposing boarding fees or head taxes on persons traveling in air commerce.

MAJOR TAX ACTIONS IN 1974

General Sales Taxes

This year Arizona increased its general sales and use tax rate from 3.0 to 4.0 percent, and by a 1973 law, California raised its state from 3.75 to 4.75 percent. Tennessee postponed lowering its 3.5 percent rate to 3.0 percent from July 1, 1974, to July 1, 1975, while also postponing a slight rise in the local tax rate ceiling. Connecticut reduced its general rate from 6.5 percent to 6.0 percent.

Although most of the other state actions involved exemptions, both Virginia and South Dakota broadened their sales tax bases.

Arizona also imposed a special 2 percent excise tax for education on several types of businesses already subject to a 2 percent sales and use tax rate. Exemptions for drugs, medical supplies, pollution control equipment, and services sold by nonprofit organizations were adopted by still more states. Four states (Idaho, Illinois, Indiana, and Wyoming) exempted meals sold to the elderly or confined under nutrition programs. Iowa exempted all food eligible for purchase with food stamps, and both Colorado and Nebraska increased the food sales tax credits allowed against income taxes. Three New England states

(Maine, Rhode Island, and Vermont) reduced manufacturing tax burdens by lowering or eliminating sales taxes on manufacturing equipment and machinery. Other states enacting sales tax exemptions included Arizona, California, Florida, New York, and Virginia.

Illinois has authorized municipal and county use taxes of not more than 1.0 percent. Ohio, Utah, and Washington have authorized local sales taxes for public transit purposes once the local electorates approve. The maximum rates are 1.5 percent, 0.25 percent, and 0.3 percent, respectively. California has extended the 0.5 percent BART transactions and use tax until 1978.

Individual Income Taxes

Thus far in 1974 no state has enacted a general rate increase. For the second consecutive year Oregon voters rejected individual and corporate income tax rate increases, and the new Louisiana constitution prohibits rates higher than the present ones. Georgia, however, made bank dividends taxable, and North Carolina eliminated the deductions for dividends from domestic financial institutions. Vermont subjected sales of five acres or less of land to a special capital gains tax, and California disallowed deductions arising from ownership of substandard housing.

Four states reduced taxes generally. New Mexico lowered rates for most brackets and increased credit for state and local taxes paid by lower income taxpayers. Pennsylvania decreased its 2.3 percent rate to 2.0 percent and enacted total forgiveness or total or partial refunds for low income families. Both Ohio and Montana raised personal exemptions. Iowa doubled both the optional standard deduction and the

deduction limit for federal taxes, and New York extended the suspension of the 2.5 percent surcharge for another year.

Several states enacted or extended other various credits for low income, investment, and sales (especially food) and excise taxes. A deduction for day care expenses was adopted by three states. Increased benefits for the elderly were variously achieved by: an increased deduction for the surviving spouse (California), exemption of capital gains for a residence of five years (Connecticut), exemption of pensions and retirement premiums from qualified plans (lowa) and public employees' retirement pensions (West Virginia), and an additional exemption against pension income (South Carolina). Massachusetts excluded from its income tax the interest or dividends from time deposits of less than \$100,000. North Carolina allowed resident owners of multi-family structures a new tax credit.

In terms of local taxing authority, Indiana counties that had initially rejected a local income tax could reconsider the decision sooner than formerly, and New York City was authorized to continue its higher rates for another year.

Corporate Income Taxes

Arizona increased the rates on all the corporate income tax brackets ranging from 2.0 to 2.5 percent on the first \$1,000 to 10.5 percent rather than 8.0 percent on net taxable income over \$6,000. Vermont also raised rates by replacing a flat 6.0 percent with rates ranging from 5.0 percent on the first \$10,000 to 7.5 percent on excess over \$250,000. Maryland restored the oil percentage depletion allow-

ance to the computation of taxable net income. And one state, Pennsylvania, reduced its net income tax from 11.0 to 9.5 percent.

More financial institutions became subject to income taxation as Delaware, North Carolina, and Georgia replaced various other taxes on banks with state income taxes. Bank holding companies in Michigan became subject to the income tax, and the South Carolina bank income tax was no longer in lieu of various other taxes.

Relief granted in 1974 was fairly selective. Dividends in the District of Columbia from companies already subject to certain District taxes were exempted. Among other measures New York and Rhode Island raised investment tax credit, and Tennessee liberalized the definition of owned subsidiary for purposes of dividend exclusion. Indiana granted increased credit against gross income for hiring unemployed persons, and Arizona allowed deductions for the cost of constructing day care facilities. Both New York and North Carolina encouraged housing investment by respectively granting an exemption to limited profits housing companies and granting a limited tax credit for each unit completed to corporate owners of multi-family structures built for the handicapped.

Special Sales Taxes

Motor fuels taxes were raised by two states, Arizona and Pennsylvania, and a higher rate scheduled to end was continued indefinitely in Delaware. Six states allowed partial or full gas tax refunds when sold for uses in such vehicles as school or public buses and construction equipment.

131

Cigarette tax rates were increased in Arizona and Maine, and little cigars were subjected to the cigarette tax rate in Minnesota. Rhode Island repealed the tax of 25 percent of the wholesale price that had been levied on cigars and non-cigarette tobacco. The Louisiana taxes on tobacco were placed on an <u>ad valorem</u> basis, using invoice price, rather than the former combination of retail price and weight for cigars and retail price for tobacco.

Arizona increased its rate on distilled spirits, and Montana increased its <u>ad valorem</u> license tax on liquor and its per barrel tax on beer. Massachusetts raised its tax rates on wine, while Oregon levied an additional privilege tax on wine. Vermont replaced its volume basis for taxing wine and liquor with an <u>ad valorem</u> basis. Idaho, however, reduced the surcharge on liquor sold through the state stores, and Louisiana reduced the rate on beverages of low alcoholic content. Georgia required counties and municipalities permitting sale to levy a local beer excise tax, and West Virginia placed a tax on liquor purchased outside municipalities.

Other Taxes

The recent surge of property tax relief programs abated somewhat in 1974. Only 19 states enacted new and increased realty tax credits and exemptions for especially the elderly, the poor, and the disabled, and only about half the states enacted some form of property tax relief. Both the District of Columbia and Massachusetts initiated realty tax deferral measures, mainly benefiting lower income and elderly homeowners. Michigan permitted exemptions for industrial facilities improvements in plant rehabilitation districts.

Other prevalent realty tax changes included new assessment ratios for different classes of property, and use value rather than market values as the basis for valuing agricultural and open space land. The trend to eliminate additional items from the personal property tax base was evident in several states.

State action in inheritance and estate taxation was mostly confined to increased inheritance tax exemptions in Iowa, Montana, Pennsylvania, and South Dakota. Kentucky exempted from inheritance and estate taxes that value of the annuity on federally qualified plans which is attributable to the employer contribution.

Several states chose to raise or enact new severance taxes in 1974: New Mexico (oil, gas, and coal); Oklahoma (oil and gas); Nebraska (oil and gas); Tennessee (coal); Mississippi (timber); and Wisconsin (copper concentrates). Louisiana continued indefinitely its severance tax on low oil producers, and Minnesota limited mining tax deductions. New Hampshire levied an ad valorem tax on refined petroleum products to be paid by the refiner. Only Wyoming reduced its ad valorem severances taxes.

Pari-mutuel rates were changed only in two states, Connecticut and New York, where they were raised. Noteworthy among the miscellaneous tax changes was the California adoption of an electrical energy consumption tax of 0.10 mil per kilowatt hour. A new franchise (net income) tax on insurers was enacted by New York, and the long-contested Chicago employer tax of \$3 per employee was upheld by the Illinois Supreme Court.
